

TRADITIONAL FLOCKS To Registration

In December 1908 Karakuls were brought into the US for the Persian lamb fur market. These Karakuls were not a definite breed in the “purebred” sense, rather a sheep “type”, originating from isolated flocks in Central Asia. In 1951 over four decades later, a Breed Standard was presented through Lowry Hagerman’s *The Karakul Handbook: Selecting and Breeding Karakuls for Fur Improvement*^[1] Just three years after publication the entire Persian lamb fur market collapsed. The Breed Standard was forgotten. Karakuls became isolated again; genetics were concentrated within regional areas resulting in variable physical appearances. Karakuls became locally ‘adjusted’ sheep, developed over time through adaptation to their natural and cultural environments. Sometimes through breeder selection, although often not, as many were managed as Traditional Flocks—no maintenance of pedigree and frequently multi-sire mating. This is the definition of a landrace⁸ breed.^[2,7,8] Three to four decades later most of these flocks were *found, identified, and validated** as Foundation or Historic bloodlines. Many individual sheep were *registered** from these flocks.

Now, after two more decades of isolation and breeder selection the Alliance has currently located “a dedicated core of breeders working solely with Foundation bloodlines. These [new] bloodlines tend to be free from much outside breeding, and can be among the most genetically distinctive animals of the breed.”^[3] We are utilizing the Livestock Conservancy[±]^[4] definition for a Bloodline “subpopulations that have been isolated from one another for several generations (usually four or more) with the consequence that they are somewhat genetically distinct”. From that, Alliance Advisors have chosen a minimum of five years of isolation or line-breeding generations to define a unique Karakul bloodline. Called Multi-Bloodline Composites or MBC, they fall into two types--Isolated and Line-bred. Isolated flocks are Closed having no outside genetic influences. Line-bred flocks are Open bringing in a new ram every two to five years; yet genetics are similar enough to continue selective linebreeding on a color or specific farm line. See **Bloodlines** page. Also in the past two decades, traditionally-managed isolated flocks are being found more frequently, usually being raised by ethnic shepherds who wish to remain private.

The staff of the Livestock Conservancy[±] and Dr. Phil Sponenberg^[2] have developed some guidelines for rescuing indigenous animal bloodlines and breeds. Together with their ideas and our own experience with Karakuls, we have developed procedures to define and evaluate breed type, adaptable to include *new* sheep into the KSAR Registry.

Inherent in bringing *new* animals into a Registry’s flock book is the establishment of some kind of protocol that would and could assure, as best is possible, the quality standard of breed type. The unique combination of two Central Asian characteristics, the fat-tail and Persian lamb pelt, make breed qualifying easier. Sheep with both a fat-tail and a lamb pelt are easily characterized as Karakul; no breed mis-identification is possible. Other sheep have fat tails, but only Karakuls produce Persian lamb—lustrous, patterned curls or smooth waves; thus the perpetual focus on pelts.

Registration applications for individual **un**-pedigreed Karakul sheep, of any age, will be reviewed by Alliance Advisors using the time-tested method of visual observation for breed character evaluation. See *How to Register Sheep with KSAR* regarding requested photos, and possibly a fleece sample. After evaluation and acceptance, the individual sheep will be identified by the flock into which they were born. Therefore, sheep without a registration number will carry their original Source Farm/Flock and Location as their first identifier in the Registry.^[5] Until breed-specific DNA testing becomes available, the following guidelines are endorsed and supported by Alliance Advisors^[5]:

1. Ideally isolated or line-bred Karakul flocks should not be raised with other breeds. However, if other breeds are kept, they must be noted and steps taken to avoid inadvertent cross-breeding.
2. Isolated or line-bred flock recognition is by location of breeder. Karakuls entering the Alliance Registry with one or both unregistered parents will have the sire and/or dam listed as Breeder Name/Farm and City, State as their sheep Name/ ID, *without* the usual registration number.
3. A brief history of the flock is **important** for verifying source bloodlines and will be kept on record—including original animal sources and approximate dates of acquisition. Ideally, history of *validated** **Bloodlines** is updated annually, but special attention should be paid to *gender, source, and year* when additions are made.
4. If shepherds have grouped sheep to maintain different bloodlines, the bloodlines should be noted and tracked.

Continued Over →

Karakul sheep are fundamentally independent and self-sufficient; they almost raise themselves. Low-maintenance and reasonably isolated from other flocks are typical of farm systems that have characterized Karakul breeding for centuries. The Karakul Shepherds Alliance would like to encourage purebred Karakul breeding in traditional settings. If registration is desired, within this framework the KSAR Open Flock book is available as the transition point for individual Karakul sheep progressing from isolated farms, ranches, and desert ranges into the Karakul Registry.

Alliance documents referenced can be found on the Registry and Bloodlines pages of our website karakulshepherds.org

[§] About Landrace-

Landrace^[6] is a term used to classify animals that have been raised or developed genetically isolated for fairly long periods of time. It was originated by Kurt Von Rümker in 1908; literally translated 'country-breed' from the German *Landrasse*. Geneticist Phillip Sponenberg of Virginia Tech University describes landrace creation "...when isolation, environmental pressures...and human selection plays a role, but for *end goals* (emphasis added), not as a result of careful selection."^[7] Per the Livestock Conservancy* "Landraces are by their very nature more variable.... characterized by *biological* and *adaptational* consistency and not necessarily by uniformity of physical appearance."^[8]

* Current Alliance Definitions:

FOUND – Alliance *finds* a **flock** and gives it a Flock number, but we have no history, few if any photos, no contact information, partial name or no name of the owner. This is pertinent for the 'hidden flocks' that surface, usually traditionally-managed by ethnic shepherds. We will assign *shepherd name* and/or *number*, city/region, state; the corresponding flock numbers will be designated with the suffix –NH until contact is made with the shepherd-owner. (-NH for No History)

IDENTIFIED – Alliance *identifies* a **flock** and gives it a Flock number. We have contact with the shepherd and have History and photos of the flock.

VALIDATED – Alliance *validates* an isolated or line-bred **flock** and gives it a Bloodline name. Historical sources of sheep are verified by at least one other Karakul breeder.

REGISTERED – KSAR will *register* an **individual** sheep from either of the last two flock types with application and photos after evaluation. Advisors will consider registration applications and photos of Karakul **ewes** from a FOUND flock on a case-by-case basis. If accepted, registration numbers will be designated with the suffix –NH, as an individual originating from a No History flock.
